...the cell cycle is a series of events that a cell goes through as it grows and divides. The cell cycle is divided into two main parts: interphase and mitosis. Interphase is the longest part of the cell cycle, and it is during this time that the cell grows and prepares for division. Mitosis is the process of cell division, and it is during this time that the cell's DNA is replicated and the cell's organelles are distributed to the two daughter cells.
